Tecnoplast Wins Big at SUR/FIN Las Vegas

By: Alexander Giommi

Our MISSION is to solve our customers' problems regarding gases, corrosive fumes and chemical treatment.

Our VISION is to become a point of reference in our market at international level.

Earlier this month, Tecnoplast was given an opportunity to attend SUR/FIN, a manufacturing and technology trade show and conference in Las Vegas, run by the National Association for Surface Finishing (NASF). Three representatives for Tecnoplast travelled to the conference from Anderson, Indiana. Gloria Da Ros (CEO), Matt Lucchese, and Anthony Carlson attended the sustainability summit, and the Nadcap session on Monday, June 6, and represented the company at the Tecnoplast booth for the remainder of the conference.

What Happened in Vegas...

NASF Conference attendees navigate the booths of surface finishing industry suppliers

NASF is recognized as the industry's premier trade association, and considered by many to be the voice of the surface finishing industry. This year, the SUR/FIN manufacturing and technology trade show and conference welcomed over 180 surface finishing industry suppliers, and featured more than 80 presentations by professionals and industry experts on a wide range of topics, including advances in surface finishing, best practices, regulatory issues, business management and strategy, to name a few. The purpose of the conference was to gain meaningful insights into the future of the surface technology industry.

Our representatives had the opportunity to see first-hand the innovative technologies offered by exhibitors, and learned about the emerging issues and industry practices. They attended two presentations: the sustainability summit, and the Nadcap session. The former was a conference that focused on demonstrating the best practices for surface finishing, touching on the trends, tools,

and regulation of the practice. Three panelists spoke of sustainability within their respective fields, but one moment that struck Mr. Carlson was when George Cushnie of the National Center for Manufacturing Sciences said, "[Sustainability is] doing your job today, right, so that it does not screw up tomorrow." This quote resonated with our delegate. It seems so simple, yet it is often overlooked in a search for sustainability. In the adjacent room, Matt Akin of TrueLogic Company chaired the Nadcap session. His presentations, "Raising Your Game to Aerospace Quality" and "Succession Planning to Maintain Quality," touched the topics of increasing and maintaining quality.

Our delegates manned the Tecnoplast booth for the following two days where they showcased our products with videos, banners, and samples. Several potential customers showed interest in Tecnoplast, and our representatives returned to Anderson with excellent satisfaction.

"[Sustainability is] doing your job today, right, so that it does not screw up tomorrow."
